

## Drugz

Turn signals in the front of motorcycle are dual intensity, they light up as a low intensity running light at approximately 30% of full brightness and when the turn signal is activated they go from the running light to full brightness. Drugz are designed to increase your visibility in different ways. First, the running light intensity is changed from 30% of full brightness to 100% of full brightness making your motorcycle more visible all at times. Secondly, when a turn signal is activated the LEDs flash from 100% to 0% brightness giving more difference as a turn signal, increasing your visibility when you are turning. Next, because Drugz use 48 high powered wide angle amber LEDs, they provide more light output than standard incandescent bulbs. Finally, because LEDs illuminate 1/5 of a second faster than standard incandescent bulbs, this provides greater reaction time for other vehicles.

## Dogeyes

Dogeyes are a multi-color LED Clusters used for rear turn signal applications. The clusters are 1.85" in diameter and contain 48 super bright LEDs. The outer ring contains Amber LEDs while all inner LEDs are dual intensity Red. The Amber LEDs are connected to an 1156 base while the dual intensity Red LEDs is connected to 3' wire pigtailed.

These clusters can be wired as: Red low intensity Running light, Red High Intensity Brake Light, Amber High Intensity Turn Signals, this allows your rear turn signals to be converted from simple turn signals to Dynamic running, brake, and turns signals, all in one unit. Installation is very simple, just plug the 1156 base to the stock turn signal housing receptacle, run the orange running light wire and the red brake light wires through the stock turn signal steams back to the taillight, connect the orange wire to the stock running light and the red wire to the stock brake light wire.
